Liver: The Largest Organ of the Body

Thursday, February 24, 2011

10:00 -11:00 AM

Our liver is the only organ of the body capable of self-regeneration. Our liver also plays a major role in metabolism and has a number of functions in the body, including glycogen storage, decomposition of red blood cells, plasma protein synthesis, hormone and bile production, and detoxification. Because our liver has many responsibilities, there is currently no way to compensate for its absence. Some liver diseases are preventable and are associated with lifestyle choices. Come out and learn more about the liver, the largest organ of the body. This presentation is *Free of Charge*.

Presented by: Scripps Mercy Hospital Chula Vista Well Being Center

Congregational Towers

288 F Street

Chula Vista, CA 91910
