# Financial Disclosure

**Investigators have no relevant financial interests to disclose.**

**Study drug for the clinical trial component was provided by Pfizer Pharmaceuticals, Inc.**

**Funding for the lab study and clinical trial were provided by NIAAA grants number AA012602 and AA014028, respectively.**

# **Educational Objectives:**

- 1. Identify symptoms of an alcohol use disorder**
- 2. Understand the role of medications in treating alcohol dependence**
- 3. Identify symptoms of relapse risk after alcohol withdrawal**
- 4. Evaluate the research data assessing the risks and benefits of gabapentin in patients with alcohol dependence**

# What is a Standard Drink?

**12 fl oz of regular beer** = **5 fl oz of table wine** = **1.5 fl oz shot of 80-proof spirits**  
(“hard liquor”— whiskey, gin, rum, vodka, tequila, etc.)

about 5% alcohol      about 12% alcohol      about 40% alcohol

The percent of “pure” alcohol, expressed here as alcohol by volume (alc/vol), varies by beverage.

# Definitions

- **Moderate “Low Risk” Drinking**
  - **Women:  $\leq 3$  drinks on any single day AND  $\leq 7$  drinks per week**
  - **Men:  $\leq 4$  drinks on any single day AND  $\leq 14$  drinks per week**
- **Heavy “At Risk” Drinking**
  - **Women:  $\geq 4$  drinks on any single day OR  $> 7$  drinks per week**
  - **Men:  $\geq 5$  drinks on any single day OR  $> 14$  drinks per week**
- **Binge Drinking: BAC reaches 0.08g/dL within 2 hours**
  - **Women:  $\approx 4$  drinks**
  - **Men:  $\approx 5$  drinks**

**DSM IV: Alcohol Dependence ( $\geq 3$  of the following):**

**DSM V: Alcohol Use Disorder ( $\geq 2$ ; moderate severity  $\geq 4$  of the following):**

**A problematic pattern of alcohol use within a 12-month period:**

- 1. Often drinking more than was intended**
- 2. Unsuccessful attempts to cut-down or control alcohol use**
- 3. A great deal of time spent in alcohol-related activities**
- 4. Activities given up or reduced because of drinking**
- 5. Continue drinking despite alcohol-related physical or psychological problems**
- 6. Tolerance**
- 7. Withdrawal**
- 8. Craving**
- 9. Drinking impairs functioning at work, school or home**
- 10. Continued drinking despite alcohol-related social or interpersonal problems**
- 11. Drinking in physically hazardous situations**

# Differences in Past Year Prevalence, Diagnosis and Treatment of Alcohol Use Disorders in Diverse Populations Residing in San Diego County

# **Alcohol Use Disorders Can Undermine Diagnosis and Treatment of Comorbid Medical Conditions**

- **Postpone seeking treatment**
- **Engage in risky behaviors**
- **Failure to follow medication regimens**
- **Contribute to conditions such as liver disease**
- **Weaken immune system**
- **Increase risk of side effects from some medications**
- **Can reduce efficacy of some medications**

# Background

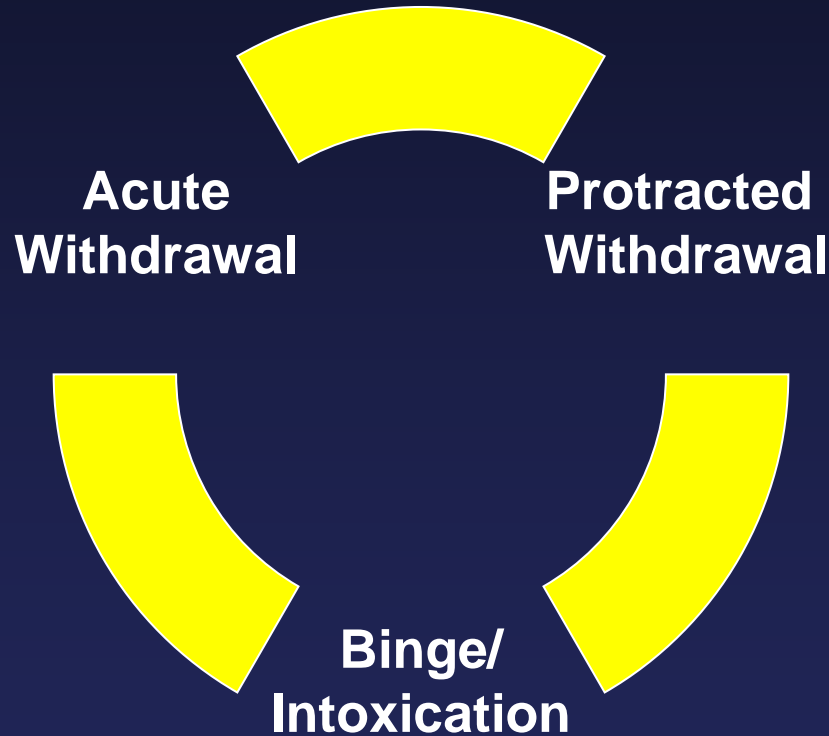

## Alcohol Use Disorder is a large unmet medical need

- Accounts for 3.8% of all deaths and 4.6% of disability-adjusted life-years globally
- Costs exceed 1% of the gross national product of high and middle income countries

## Existing treatments are grossly underutilized

- Approved pharmacological treatments are prescribed for < 9% of Americans with alcohol dependence
- Worldwide sales of approved treatments
  - Disulfiram (Antabuse): ?
  - Naltrexone (ReVia, Vivitrol): \$41M
  - Acamprosate (Campral): \$81M

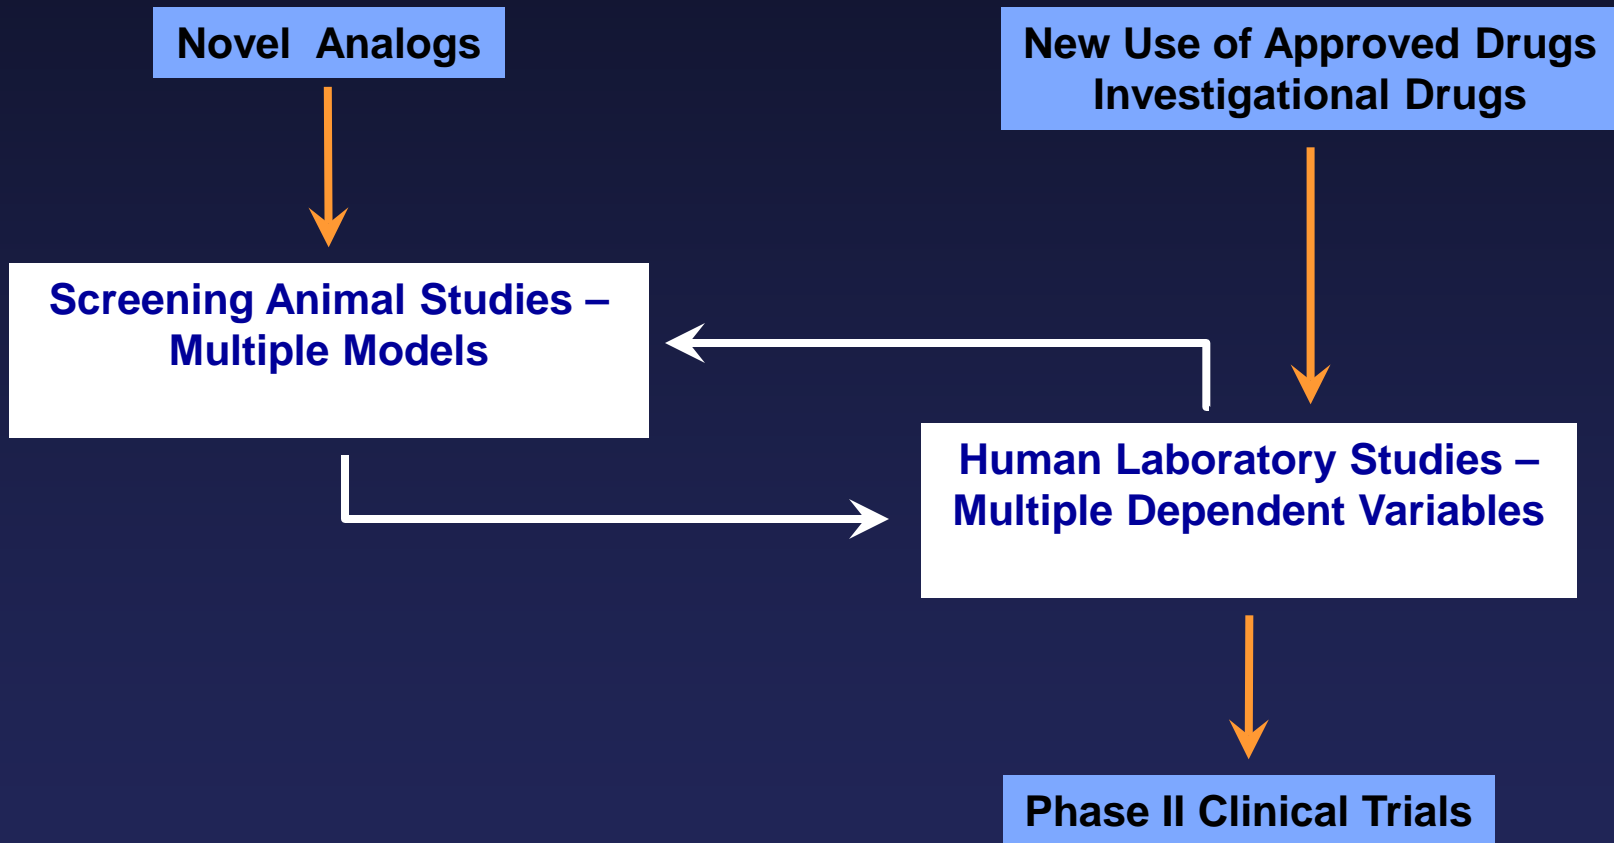

# Medication Targets in the Cycle of Alcoholism

# **Rational Drug Development for Alcohol Use Disorder**

- **Identify and preclinically validate targets relevant to treating persisting negative emotional states associated with the withdrawal/negative affect and preoccupation/anticipation (“craving”) stages of the addiction cycle**
- **Reliable, valid and correct human laboratory models for proof of concept (POC)**
- **New pharmacotherapies with larger effect sizes and good safety and tolerability profiles**

# Medications Development for Treatment of Alcoholism and Addiction

# **Rationale for Gabapentin as a Potential Treatment for Alcohol Dependence**

**FDA-approved for epilepsy and pain (Neurontin)**

- Enhances GABAergic function via an action on voltage-gated calcium channels (Sills, 2006)**
- Normalizes alcohol-related dysregulation in GABA-CRF interactions in the extended amygdala (Roberto et al., 2008)**

**Used off-label to treat symptoms associated with protracted withdrawal and risk of relapse**

- Disturbances in mood and insomnia (Brower et al., 2008)**

**Safe and well-tolerated in acute withdrawal and in combination with alcohol (e.g., Myrick et al., 1998, 2007)**

- Not appreciably metabolized in the liver**

# Laboratory Studies: Gabapentin Effects on Drinking and Craving

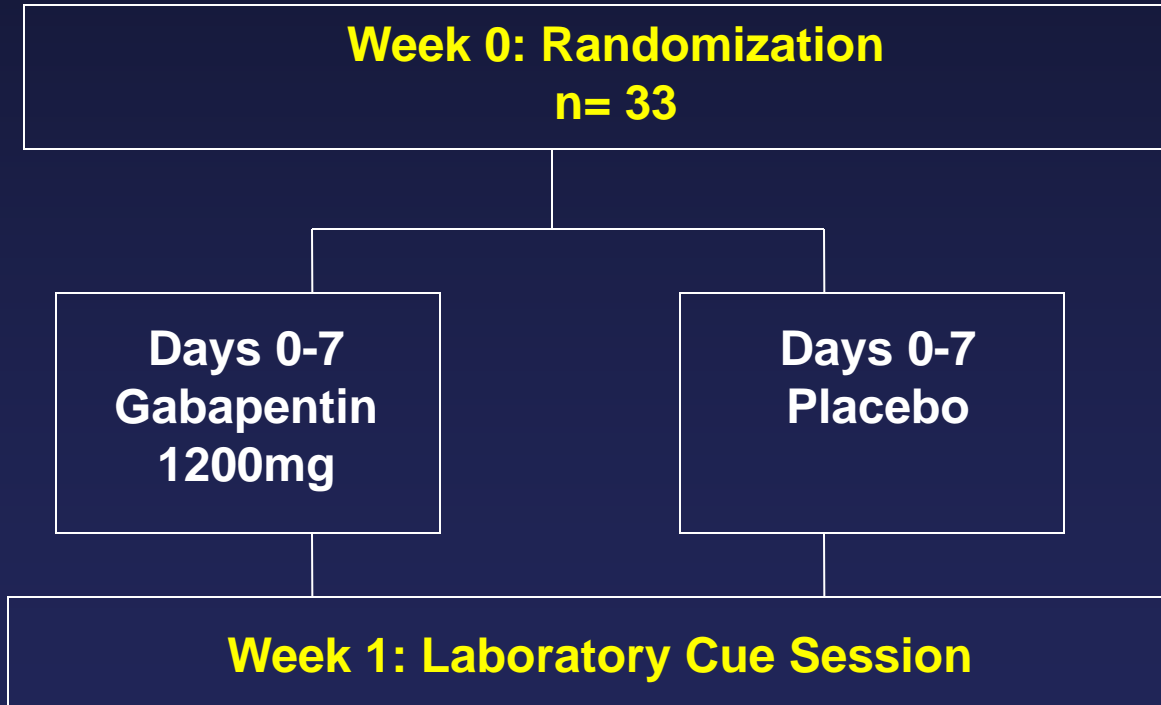

## Human Studies

- Safe, but no efficacy for a single dose in an alcohol administration paradigm in normal subjects  
- *Bisaga & Evans, 2006*
- Safe, but no efficacy for 1-week dosing in an alcohol administration /consumption paradigm in alcoholics  
- *Myrick et al., 2007*

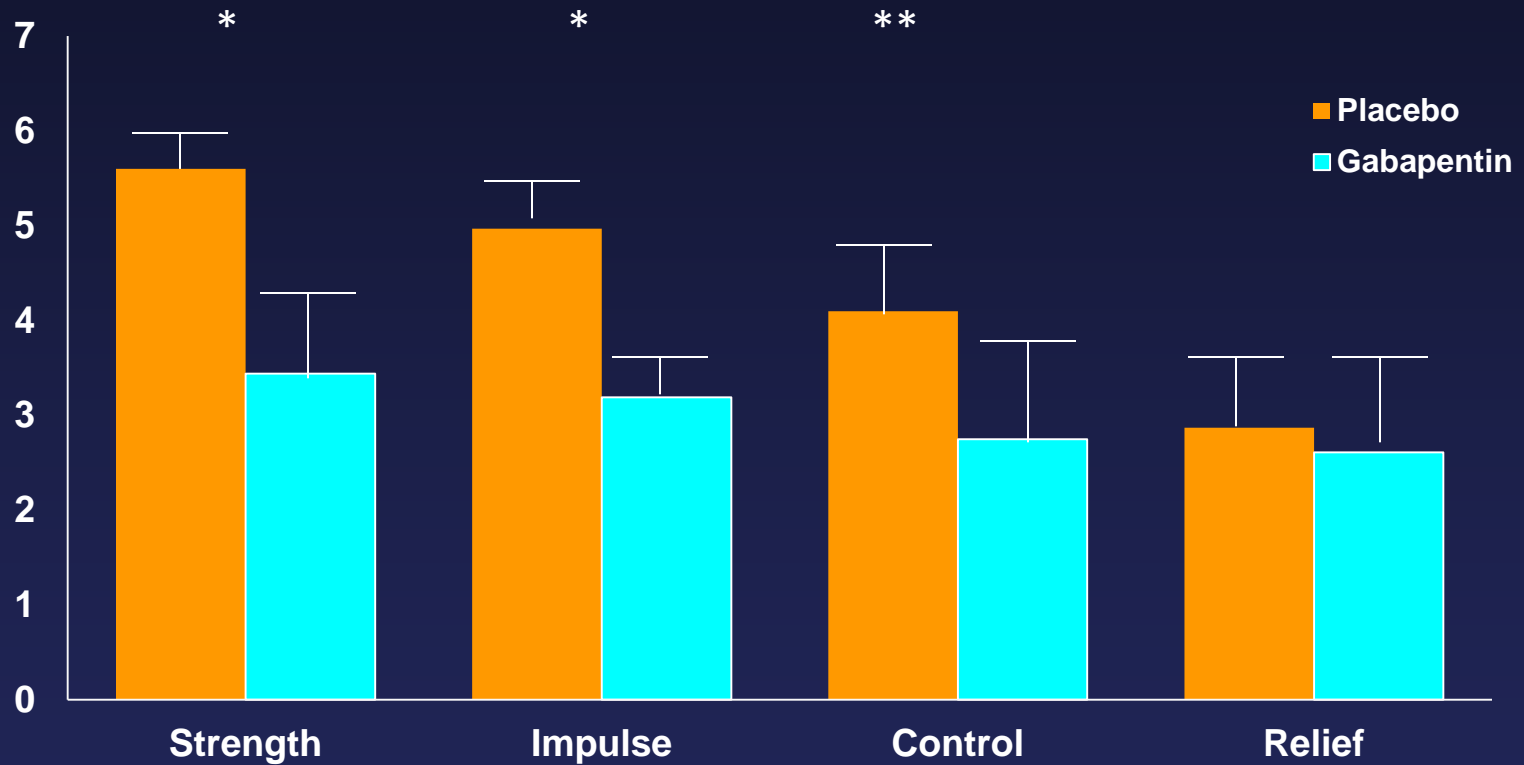

## Pre-Clinical

- Dose-dependent reduction in ethanol self-administration in dependent rats
- No effect in non dependent rats  
- *Roberto et al., 2008*

# POC Human Laboratory Cue Reactivity Study: Gabapentin in Alcohol Dependence

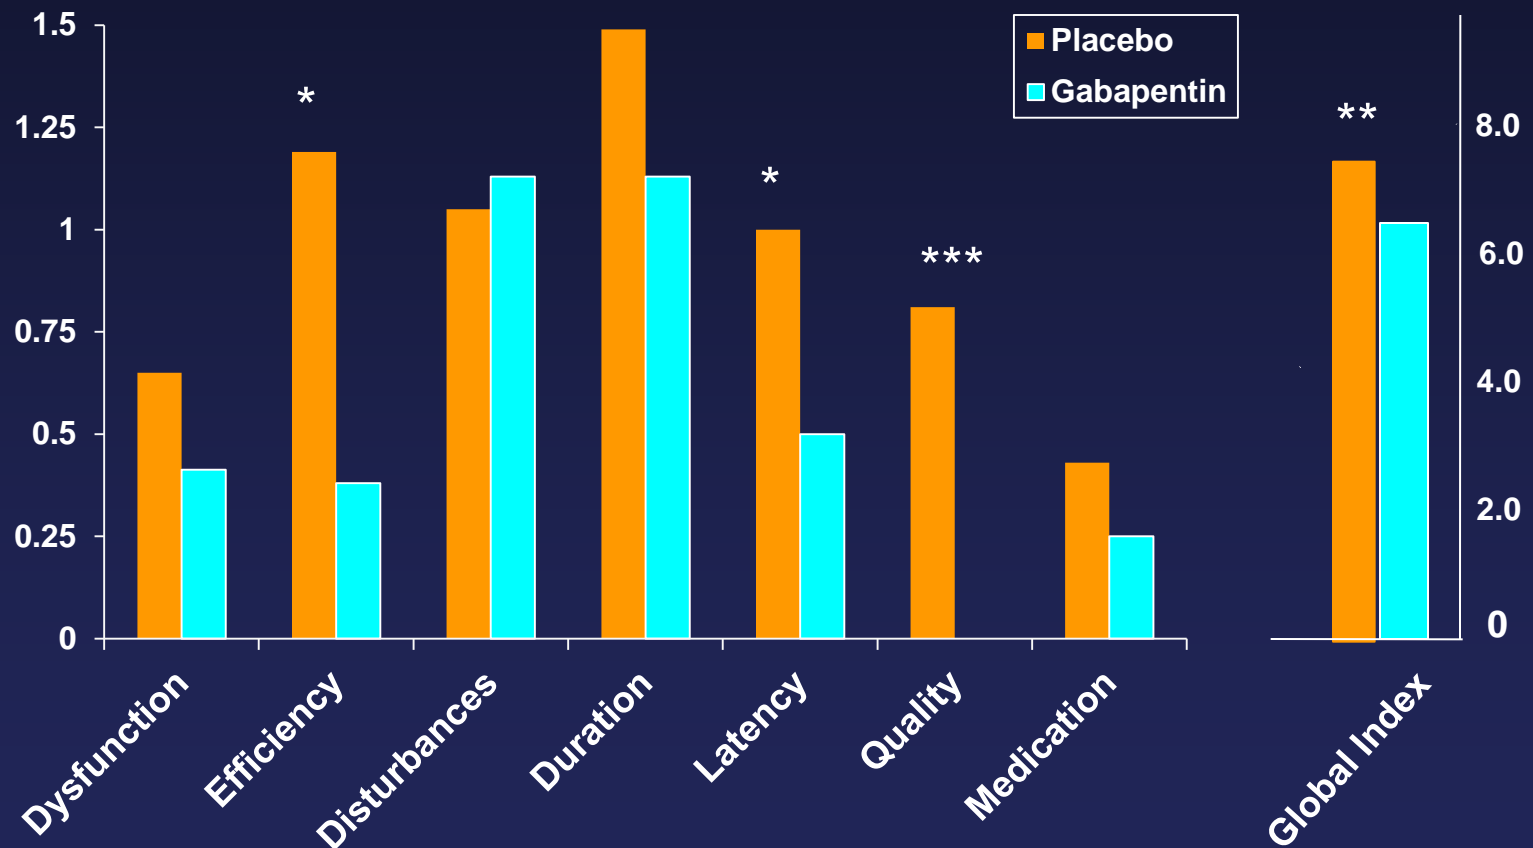

# VAS Craving Scores: Alcohol Minus Water

\* $p < 0.05$

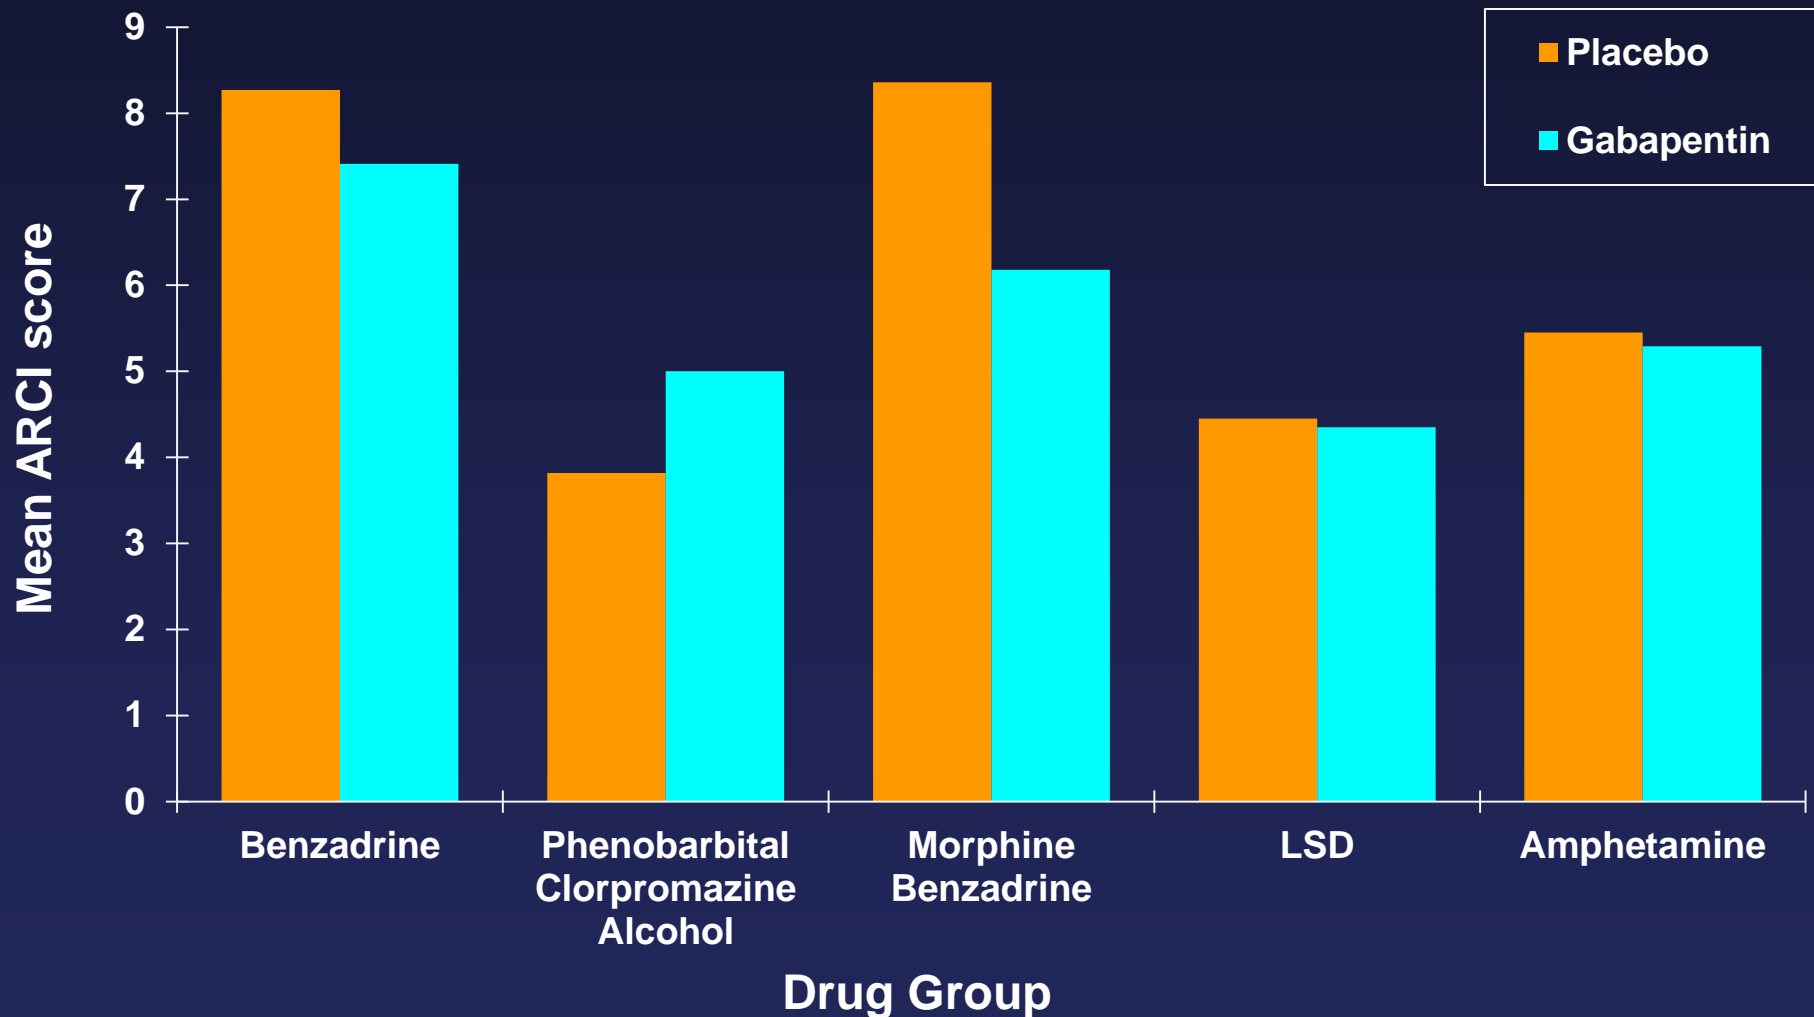

\*\* $p < 0.1$

# Effect of Gabapentin vs Placebo on Pittsburgh Sleep Quality Index<sup>1</sup>

<sup>1</sup> Higher values indicate greater disturbance; subscale range 0-2  
\*\*\* $p < 0.001$ ; \*\* $p < 0.05$ ; \* $p < 0.06$

# Gabapentin Does Not Show Abuse Potential on the Addiction Research Center Inventory (ARCI)

# **POC Cue Reactivity Human Laboratory Study**

**Gabapentin vs placebo was associated with**

- decreased craving ( $p < .05$ )**
- improved sleep ( $p < .05$ )**
- good safety and tolerability**
- no evidence of abuse potential**

**A randomized controlled trial (RCT) to evaluate the efficacy of gabapentin for relapse prevention in alcohol dependence is warranted.**

## Original Investigation

# Gabapentin Treatment for Alcohol Dependence A Randomized Clinical Trial

Barbara J. Mason, PhD; Susan Quello, BA, BS; Vivian Goodell, MPH; Farhad Shadan, MD; Mark Kyle, MD; Adnan Begovic, MD

**IMPORTANCE** Approved medications for alcohol dependence are prescribed for less than 9% of US alcoholics.

**OBJECTIVE** To determine if gabapentin, a widely prescribed generic calcium channel/ $\gamma$ -aminobutyric acid-modulating medication, increases rates of sustained abstinence and no heavy drinking and decreases alcohol-related insomnia, dysphoria, and craving, in a dose-dependent manner.

**DESIGN, PARTICIPANTS AND SETTING** A 12-week, double-blind, placebo-controlled, randomized dose-ranging trial of 150 men and women older than 18 years with current alcohol dependence, conducted from 2004 through 2010 at a single-site, outpatient clinical research facility adjoining a general medical hospital.

**INTERVENTIONS** Oral gabapentin (dosages of 0 [placebo], 900 mg, or 1800 mg/d) and concomitant manual-guided counseling.

**MAIN OUTCOMES AND MEASURES** Rates of complete abstinence and no heavy drinking (coprimary) and changes in mood, sleep, and craving (secondary) over the 12-week study.

**RESULTS** Gabapentin significantly improved the rates of abstinence and no heavy drinking. The abstinence rate was 4.1% (95% CI, 1.1%-13.7%) in the placebo group, 11.1% (95% CI, 5.2%-22.2%) in the 900-mg group, and 17.0% (95% CI, 8.9%-30.1%) in the 1800-mg group ( $P = .04$  for linear dose effect; number needed to treat [NNT] = 8 for 1800 mg). The no heavy drinking rate was 22.5% (95% CI, 13.6%-37.2%) in the placebo group, 29.6% (95% CI, 19.1%-42.8%) in the 900-mg group, and 44.7% (95% CI, 31.4%-58.8%) in the 1800-mg group ( $P = .02$  for linear dose effect; NNT = 5 for 1800 mg). Similar linear dose effects were obtained with measures of mood ( $F_2 = 7.37$ ;  $P = .001$ ), sleep ( $F_2 = 136$ ;  $P < .001$ ), and craving ( $F_2 = 3.56$ ;  $P = .03$ ). There were no serious drug-related adverse events, and terminations owing to adverse events (9 of 150 participants), time in the study (mean [SD], 9.1 [3.8] weeks), and rate of study completion (85 of 150 participants) did not differ among groups.

**CONCLUSIONS AND RELEVANCE** Gabapentin (particularly the 1800-mg dosage) was effective in treating alcohol dependence and relapse-related symptoms of insomnia, dysphoria, and craving, with a favorable safety profile. Increased implementation of pharmacological treatment of alcohol dependence in primary care may be a major benefit of gabapentin as a treatment option for alcohol dependence.

**TRIAL REGISTRATION** clinicaltrials.gov Identifier: NCT00391716.

# Hypothesis

**Gabapentin will have efficacy for the treatment of alcohol dependence by**

- **acting directly on drinking behavior**
  - rates of abstinence and no heavy drinking
  - drinking quantity and frequency
- **acting on symptoms of protracted withdrawal that may modulate drinking behavior, e.g., craving and disturbances in mood and sleep**

# Methods

## Procedures

- Double-blind
- Random assignment
- Dose-ranging: 0, 900, 1800 mg/d gabapentin
- 12-week study duration and post treatment follow up at Weeks 13 and 24
- Weekly abstinence-oriented counseling ([www.alcoholfree.info](http://www.alcoholfree.info))

# Gabapentin Dose Titration Schedule: Number of 300 mg Capsules Dispensed

|             | Morning           | Afternoon | Evening |
|-------------|-------------------|-----------|---------|
| Day 1       | ○○                | ○○        | ●○      |

# Methods

## Dependent Measures

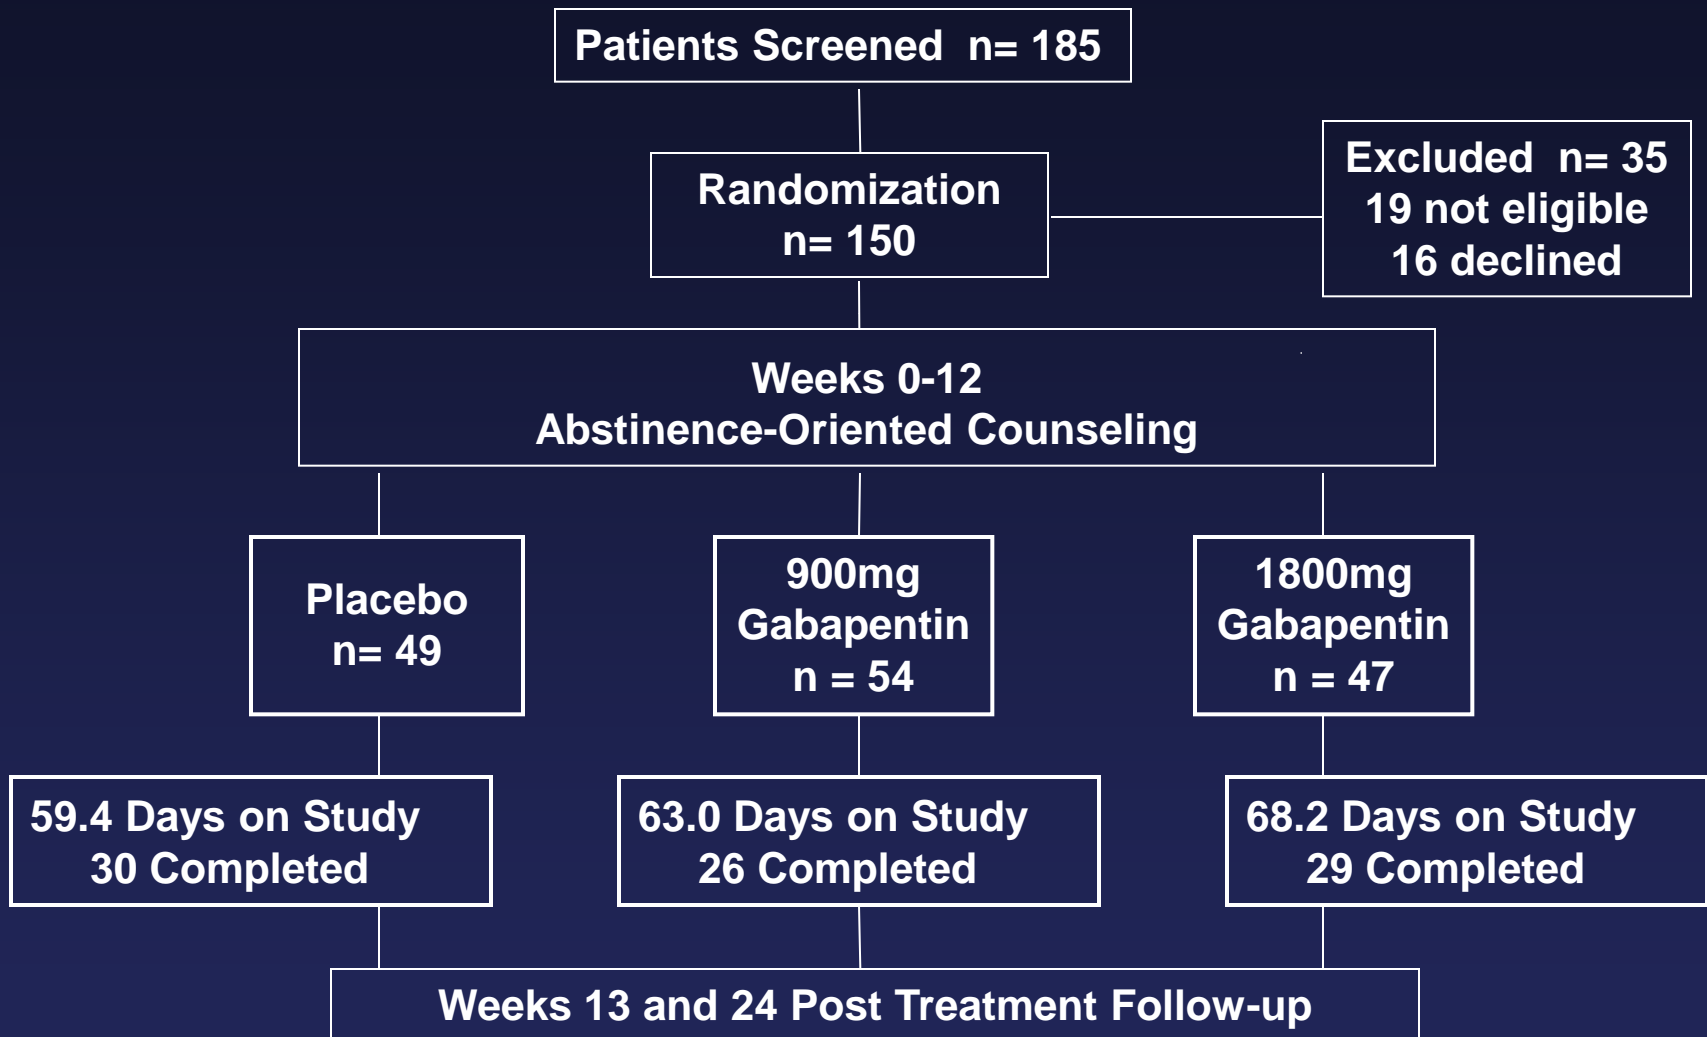

- **Timeline Follow Back Interview (Sobell & Sobell, 1992)**
- **Alcohol Craving Questionnaire (Singleton et al., 1994)**
- **Pittsburgh Sleep Quality Index (Buysse et al., 1989)**
- **Beck Depression Inventory-II (Beck et al., 1996)**

# Methods

## Admission Criteria

- Males or females over 18 years of age
- DSM IV criteria for current alcohol dependence
- Abstinent 3 to 30 days
- No major medical or psychiatric conditions, including depressive, anxiety or dependence disorders other than alcohol or nicotine dependence
- No treatment with other psychoactive medications

# Disposition of Patients

# Baseline Characteristics (n = 150)<sup>1</sup>

# Summary

- **Gabapentin dose dependently, significantly improved**
  - rates of complete abstinence and no heavy drinking
  - drinking quantity and frequency
  - GGT
  - alcohol craving
  - sleep disturbance
  - negative affective symptoms
- **Gabapentin was well-tolerated with no serious or unexpected drug-related adverse events or evidence of abuse potential**

# Clinical Implications

- **Gabapentin is a cost- effective treatment for alcohol dependence**
- **Dose response effects on drinking were found throughout 12 weeks of double-blind treatment and 24 weeks of post treatment follow up, suggesting a return to homeostasis in brain stress systems with no evidence of tolerance or rebound symptoms with drug off titration**
- **Although non compliance may be an issue with disulfiram and naltrexone, patients complied with a treatment associated with reduced drinking and improved mood, sleep and craving**
- **Positive outcomes for gabapentin lend support to the role of neuromodulating drugs that target the dysregulation in brain stress systems associated with protracted abstinence for the treatment of alcohol dependence**

# Translating Our Research Into Practice

## Challenges

No industry support for FDA approval of a new use for a generic drug that has shown promise for treating CNS disorders, e.g., alcohol dependence, that have few effective treatment options.

## Advantages

Alcohol dependence is found – and gabapentin is widely used – across medical specialties. Reported benefits of gabapentin for alcohol dependence may result in a broader interest in alcoholism treatment across diverse medical settings.
